PROJECT REPORT

1. Introduction

With the rapid growth of streaming platforms, users are often overwhelmed by the large number of available shows. In particular, Korean dramas (K-dramas) have gained global popularity, making it difficult for viewers to decide what to watch next.

This project aims to build a simple recommendation system that suggests K-dramas to users based on their preferences, helping them discover content more efficiently.

2. Problem Statement

Users often face difficulty in selecting K-dramas due to:

- A large number of available shows
- Lack of personalized recommendations
- Time wasted searching for suitable content

The goal of this project is to develop a system that recommends K-dramas based on user interests such as genre, rating, or previously liked shows.

3. Objectives

- To design a system that recommends K-dramas
- To reduce user effort in searching for content
- To apply basic programming and data handling concepts
- To create a user-friendly interface (CLI or simple UI)

4. Methodology

The project follows these steps:

1. **Data Collection**
    - A dataset of K-dramas is created (manually or from online sources)
    - Includes fields like:

        - Title
        - Genre
        - Rating
2. **User Input**
    - User selects preferences (e.g., genre)
3. **Recommendation Logic**
    - Filter dramas based on user input
    - Sort by rating or popularity
4. **Output**
    - Display recommended K-dramas

5. Tools and Technologies Used

- Programming Language: Python
- Data Handling: Lists / CSV files
- Platform: Local system / VS Code

6. Implementation

The system is implemented as a simple program that:

- Stores K-drama data in a list or file
- Accepts user input for preferred genre
- Filters dramas matching the input
- Displays a list of recommended shows

Example features:

- Genre-based filtering
- Top-rated drama suggestions
- Simple menu-based interaction

7. Challenges Faced

- Collecting and organizing relevant K-drama data
- Handling user input correctly
- Designing a simple but effective recommendation logic
- Debugging errors during implementation

8. Results

The system successfully:

- Recommends K-dramas based on user preferences
- Reduces time spent searching for content
- Provides a simple and effective solution

9. Future Enhancements

- Add more advanced recommendation algorithms
- Use machine learning for personalized suggestions
- Develop a web-based interface
- Integrate real-time data from APIs

10. Conclusion

This project demonstrates how a basic recommendation system can improve user experience by simplifying decision-making. It also helped in understanding programming concepts such as data handling, filtering, and user interaction.

11. Learning Outcomes

- Learned how to structure a real-world project
- Improved problem-solving skills
- Gained experience in Python programming
- Understood basics of recommendation systems
